                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a method for identifying a modulator of gamma aminobutyric acid_B (GABA_B) receptor-mediated activity, by monitoring the interaction between a CREB/AFF transcription factor capable of binding to GABA_B receptor. The present sequence is human AFFx, which was used in the method of the present invention. AFFx is a member of the CREB/AFF family of transcription factors. AFFx contains a bZIP domain, by which it interacts with the coiled coil domain of GABA_B receptor. Modulators of GABA_B receptor activity are useful for treating central nervous system or peripheral nervous system disorders. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying modulators of gamma aminobutyric acid(GABA)-B receptor mediated activity by monitoring the interaction between GABAB receptor and the CREB/ATF transcription factors in the presence of a test
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       31-AUG-1999; 99GB-0020569.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes primer sets for synthesising 5602 cc full-length cDNAs defined in the specification. Where a primer set cc comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of cc the 5602 nucleotide sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises at sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end complementary to a polynucleotide comprises at least 15 nucleotides; or (b) a combination of complementary to a polynucleotide which comprises a 3'-end sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the coligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in ct the specification. The primers sets can be used in antisense therapy and comprises are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and CDNAs easily without any specialised methods. AAH03166 to AAH13628 and CDNAs easily without any specialised methods. AAH03165 to AAH13632 crepresent oligonucleotides, all of which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as pacibutrazol, e.g. to allow use of a gibberellin biosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence is encoded by the partial sequence of the maize D8-2023 allele.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The specification describes polypeptides encoded by the Rht gene (the its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by gibberellin. The products can be used to provide Rht expression in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               07-AUG-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by gibberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin-insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, e.g. to allow use of a gibberellin biosynthesis inhibitor to keep weeds dwarf but let crop plants grow tall. The present sequence is encoded by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; cancer associated gene; cancer antigen; detection; cancer; diagnosis; cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiasthmatic; antirheumatic; antiarthritic; antiviral;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antiinflammatory; antithyroid; antiallergic; antibacterial; antiviral; dermatological; neuroprotective; cardiant; thrombolytic; coagulant; coagulant; comotropic; vasotropic; antipsoriatic and antiangiogenic. The polynucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Polynucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoietic cells, autoimmune disorders, allergic reactions, graft versus host disease and organ rejection, modulate haemostatic or thrombolytic activity, modulate inflammation, cancers, cardiovascular disorders, neurological disease and cancers and antagonists may be also be used in drug screens. AAC78449 to AAC78457 and AAB44240 represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

```
CC AAF7113B to AAF71357 encode the Corynebacterium glutamicum homeostasis CC and adaptation (HA) proteins given in AAB79023 to AAB79242. The CC clls and production of fine chemicals, such as, an organic acid, proteins given in chemicals, such as, an organic acid, carbinoduction of fine chemicals, such as, an organic acid, proteinogenic or nonproteinogenic amino acid (preferred), purine or CC proteinogenic or nonproteinogenic amino acid (preferred), purine or CC proteinogenic or nonproteinogenic amino acid (preferred), purine or CC proteinogenic or nucleoside, nucleotide, lipid, saturated or unsaturated or carbinogenic acid, proteinogenic or unsaturated or proteinogenic or proteinogenic or saturated or unsaturated or unsaturated or unsaturated or unsaturated or glutamate, aspartate, glycine, serine, threonine, glutamine, corporate, arginine, protline, histidine, corporate, phenylalanine, or tryptophan. The fine chemical production can be modulated. The presence or tryptophan. The fine chemical production can be modulated. The presence or activity of corynebacterium or corporate amino or can be used to map the C. glutamicum genome or can be used for diagnosing the proteins encoded by the (I) are used to maintain compositasis in C. glutamicum or help the microorganism to adapt to corporate or conditions.

CC AAF71138 to AAF71357 encode the Corynebacterium glutamicum homeostasis CC and adaptation (HA) proteins given in AAB79023 to AAB79242. The CC .glutamicum HA genes (I) can be used in vectors for expression in host C cells and production of fine chemicals, such as, an organic acid, C proteinogenic or nonproteinogenic amino acid (preferred), purine or C pyrimidine base, nucleoside, nucleotide, lipid, saturated or unsaturated CC fatty acid, diol, carbohydrate, aronatic compound, vitamin, cofactor, CC polyketide or enzyme. The amino acids produced can be lysine, glutamine, CC cysteine, valine, leucine, isoleucine, arginine, proline, methionine, CC glutamate, alanine, or tryptophan. The fine chemical production can be modulated. The presence of (I) or HA proteins encoded by then are CC used for diagnosing the presence or activity of Corynebacterium. The HA proteins encoded by the C glutamicum genome or can be CC used as markers for genetically engineered Corynebacterium or Brevibacterium. The HA proteins encoded by the (I) are used to maintain CC homeostasis in C. glutamicum or help the microorganism to adapt to

ALTERNATIVE PRODUCTS: AT LEAST 2 ISOFORMS; A LONG FORM (SHOWN ALTERNATIVE PRODUCTS: AT LEAST 2 ISOFORMS; A LONG FORM (SHOWN HERE) AND A SHORT FORM; ARE PRODUCED BY ALTERNATIVE SPLICING.
TISSUE SPECIFICITY: IN ALL TISSUES TESTED INCLUDING BRAIN, THYMUS SPLEEN AND LIVER.
SPLEEN AND LIVER.
DOMAIN: COMPOSED OF THREE DOMAINS: A MODULATING N-TERMINAL DOMAIN, A DNA-BINDING DOMAIN AND A C-TERMINAL STEROID-BINDING DOMAIN.
SIMILARITY: BELONGS TO THE NUCLEAR HORMONE RECEPTORS FAMILY.

-I- ALTERNATIVE PRODUCTS: ALTERNATIVE SPLICING SEEMS TO GIVE RISE TO A 480 AMINO ACIDS SHORTER ISOFORM. THIS PRODUCT CANNOT BE EXPLAINED BY A SIMPLE SPLICING EVENT.
-I- TISSUE SPECIFICITY: THE HIGHEST LEVEL IS SEEN THROUGHOUT THE BRAIN, BUT IT IS ALSO FOUND IN THE STOMACH, HEART, TESTIS, ADIPOSE TISSUE, MUSCLE, SPLEEN, LIVER, AND KIDNEY.
-I- DEVELOPMENTAL STAGE: PREDOMINANT EXPRESSION IN NEURONAL TISSUES AT ALL DEVELOPMENTAL STAGES, IN 14.5 DAY OLD EMBRYOS, IT IS ALSO DETECTED IN NON-NEURONAL TISSUES. THIS EXPRESSION IS DOWN-REGULATED IN LATER STAGES OF DEVELOPMENT.
-I- POLYMORPHISM: THE FIRST POLY-PRO REPEAT STRETCH DIFFERS IN LENGTH BY ONE UNIT (THREE) IN MUS SPRETUS STRAIN CONFARED TO OTHER STRAINS, (FOUR), THE POLY-GLN REGION DOES NOT APPEAR TO BE POLYMORPHIC, EXPLAINING THE ABSENCE OF A MURINE HD-LIKE DISORDER.
-I- SIMILARITY: BELONGS TO THE HUNGTINTIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                       DOMAIN

-i- FUNCTION: REGULATORY SUBUNIT OF THE CYCLIN-DEPENDENT KINASE PAIR (CDK9/CYCLIN T) COMPLEX, ALSO CALLED POSITIVE TRANSCRIPTION ELLONGATION FACTOR B (P-TEFB), WHICH IS PROPOSED TO FACTILITATE THE TRANSITION FROM ABORTIVE TO PRODUCTION ELONGATION BY PHOSPHORYLATING THE CTD (CARBOXY-TERMINAL DOMAIN) OF THE LARGE SUBUNIT OF RNA POLYMERASE II (RNAP II). DOES NOT BIND EFFICIENTLY TO THE TRANSACTIVATION DOMAIN OF THE HIV-1 NUCLEAR TRANSCRIPTIONAL
                                                                                                                                                                                                                                                                                                                                                                                                             CONFLICT

LCOMPLEX, ALSO CALLED POSITIVE TRANSCRIPTION ELONGATION FACILITATE THE ELONGATION FACTOR B (P-TEFB), WHICH IS PROPOSED TO FACILITATE THE ELONGATION FACTOR B (P-TEFB), WHICH IS PROPOSED TO FACILITATE THE PHOSPHORYLATING THE CITD (CARBOXY TERMINAL DOMAIN) OF THE LARGE SUBUNIT OF RNA POLYMERASE II (RNAP II). BINDS ALSO TO THE TRANSACTIVATION DOMAIN OF THE HIV-1 NUCLEAR TRANSCRIPTIONAL ACTIVATOR, TAT. IT IS PROBABLY THE CIS-ACTING TRANSACTIVATION RESPONSE ELEMENT (TAR) RNA-BINDING COFACTOR FOR TAT. ALSO SERVES AS AN ESSENTIAL COFACTOR FOR HIV 2-TAT AND SIMIAN IMMUNODEFICIENCY VIRUS (AFRICAN MANDRILL) THAT FUNCTION.

-I- SUBUNIT: ASSOCIATES WITH CDK9 TO FORM P-TEFB. CYCLIN T1 IS THE PREDOMINANT CYCLIN ASSOCIATED WITH CDK9.

-I- SUBCELLULAR LOCATION: NUCLEAR.

-I- TISSUE SPECIFICITY: UBIQUITOUSLY EXPRESSED.

-I- WISCELLANEOUS: INTERRACTION BETWEEN TAT AND CYCLIN T1 REQUIRES
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Garber M.E., Wei P. SCI. U.S.A. 94:9920-9925(1997).

REPORT NATI ACAD. SCI. U.S.A. 94:9920-9925(1997).

REPORT NATIONAL THE SMN COMPLEX PLAYS AN ESSENTIAL ROLE IN SPLICEOSOMAL SURVEY AND IS REQUIRED FOR PRE-MRNA CONTROL OF MOTOR SPLICING IN THE NUCLEUS (BY SIMILARITY).

REPORT NATIONAL STABLE HETEROMERIC COMPLEX WITH SURVIVAL OF MOTOR SPLICING PROTEIN INTERACTING PROTEIN 1 (SIP1/GEMIN2), GEMIN3 AND COMPLEX IS THOUGHT TO PLAY AN ESSENTIAL ROLE IN BIOGENESIS OF THE SMALL NUCLEAR RIBONUCLEOPROTEIN PARTICLES (SURNPS). INTERACTS WITH FIBRILLARIN AND WITH SEVERAL SPLICEOSOMAL SURNP CORE SM PROTEINS, INCLUDING B/B', SM D AND SM E PROTEINS (BY SIMILARITY).

RESURCELULAR INCCATION: CYTOPLAMIC AND NUCLEAR. LOCALIZED IN SUBGELLULAR INCCATION: CYTOPLAMIC AND NUCLEAR. LOCALIZED SM CONTROL OF ARE HIGHLY ENRICHED IN SPLICEOSOMAL SURNPS (BY SIMILARITY).
